

## **ATV Tools Sample Files**

The ATV Tools Sample files are provided to show results that may be obtained using the ATV-25 test set. The Test Results files are actual files created by uploading results from ATV-25 test sets.

To use the files, start the ATV Tools program and use the File→Open or File→Import features. File→Import is used to copy the files to the local file directory making them a permanent part of the test results stored on the computer. The File→Open is used to just view the contents but not copy the file to the local Test Results.

## **Excel Files**

Two Microsoft Excel spreadsheet files are also provided. These files were created by importing the XML Test Results files directly into Excel. The Excel files have not been formatted other than to hide some columns that are not needed for the presentation of the test results.

Each of the Excel files has the test results for 100 pairs. Four actual test files were imported to create the Excel file. The original result files are also included.
